1.1 Packing list

The following table lists the products shipped with the SkyVUE 8.

Description	Quantity
Ceilometer	1
Power supply cable	1
Data cable	1
Bolt, sleeve anchor	4
Cable, USB type A plug to type B plug, 2 m	1
Triangle key	1
Calibration plate	1

1.2 General safety

This manual provides important safety considerations for the installation, operation and maintenance of the SkyVUE™8. These safety considerations are classified into three levels:

WARNING:

Warnings alert the installer or user to serious hazards. Ignoring these warnings could result in injury or death and/or irrevocable damage to the sensor unit.

CAUTION:

Cautions warn of potential hazards. Ignoring these cautions could result in the sensor being damaged and data being lost.

NOTE:

Notes highlight useful information in the installation, use and maintenance of this product. These should be followed carefully in order to gain the maximum benefit from the use of this product.

1.3 Sensor unit safety

The SkyVUE 8 sensor has been checked for safety before leaving the factory and contains no internally replaceable or modifiable parts.

WARNING:

Do not modify the SkyVUE 8 unit. Such modifications will lead to damage of the unit and could expose users to dangerous light levels and voltages.

WARNING:

Do not attempt to repair the SkyVUE 8 unit without consulting Campbell Scientific.

CAUTION:

Ensure that the correct voltage supply is provided to the sensor.

1.4 Laser safety

The SkyVUE 8 sensor incorporates an InGaAs laser diode which is rated as a class 3B device. This is an embedded laser where the output from the sensor unit, through the optics, is minimized to class 1M. This classification indicates that viewing of the beam with the naked eye is safe but looking directly into the beam with optical instruments, e.g. binoculars can be dangerous.

From the laser head the output has the following characteristics:

Maximum average power: 15.0 mW (through 50 mm)

Maximum pulse energy: 1500 nJ (through 50 mm)

Pulse duration: 100 ns

Pulse frequency: 10 kHz

Wavelength: 912 nm \pm 5 nm

Tested to: EN 60825-1:2014

Half angle divergence: 0.44 mrad

The sensor is marked with the following warning information:

INVISIBLE LASER RADIATION
DO NOT VIEW DIRECTLY WITH OPTICAL INSTRUMENTS
CLASS 1M LASER PRODUCT
IEC/EN 60825-1:2014

WARNING:

Removing the laser module with the power applied to the SkyVUE 8 or battery connected may expose the user to hazardous class 3B laser radiation.

No attempt should be made to operate the laser module outside of the housing.

WARNING:

Annually, check that the laser warning label on the sensor is still visible and can be clearly read.

When installing the sensor, avoid pointing the laser housing towards areas where binoculars are in common use.

WARNING:

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

FIGURE 1-1. Location of laser warning label

Before removing the laser module, the sensor must be disconnected from both the mains supply and the battery to ensure that the laser is turned off.

1.5 Electrical safety

Because the sensor is powered from potentially hazardous mains voltages, the power-supply should be wired only by personnel qualified to install electrical equipment. For permanent outside installations, this usually requires a certified electrician who is also familiar with local electrical and safety legislation. Some general guidance is given in [Connectors and wiring](#) (p. 18), but the responsibility for the installation lies with the installer.

The unit is tested for electrical safety before dispatch but may need subsequent testing according to local practice.

NOTE:

The unit should only be serviced by trained personnel.

WARNING:

Removal of electronic module covers or connectors while the unit is powered will expose the operator to potentially hazardous voltages and risk damage to the sensor.

The SkyVUE 8 has electrical and laser warning labels on the exterior and interior of the unit.

It is fitted with a hex-key access panel. It is recommended that the hood and access panel door are not opened in conditions of rain, hail or snow.

Isolate the sensor before removing internal components, including the cover to the avalanche photodiode (APD) module. Only trained personnel should disassemble the instrument.

Mains connectors are shrouded to prevent touching of the contacts. The mains supply should be isolated when connecting and disconnecting the cables to the sensor.

Where an isolator switch is fitted, this shall be a two-pole isolator, located as near to the sensor as possible.

The SkyVUE 8 must be properly grounded by a licensed and qualified electrician to protect against voltage leakage shock risk ([Grounding](#) (p. 15)).

Campbell Scientific recommends that RCD protection units be used with all sensors. See [Power connections](#) (p. 20) for further information.

Mains powered heaters are enclosed to prevent contact.

CAUTION:

When powered, the heaters may operate automatically and without warning. They may remain hot when not powered. Follow the isolation precautions, to avoid shock and burn hazards.

The sealed battery has cables and protected connectors to prevent shorts. Avoid shorting the battery to protect it from damage and to avoid burns to personnel through contact with hot surfaces.

2. Product overview

2.1 Introduction	6
2.2 Optical measurement	8
2.3 Internal monitoring	8
2.4 Specifications	9

2.1 Introduction

The SkyVUE 8 is a light detection and ranging (LIDAR) ceilometer that emits short pulses of near infrared light into the atmosphere from a semiconductor laser. The pulses of infrared light are scattered back by aerosols including cloud droplets. The time between transmission of the pulse and the return signal gives the range, and therefore height, of the scattering aerosols. The variation in the strength of the back-scattered light signal with height gives a profile of scatter coefficients and allows identification of cloud bases. If significant scattering is detected without a defined cloud base, then a vertical visibility can be calculated.

The control system of the SkyVUE 8 is divided into three modules, DSP, TOP and PSU as follows:

DSP (Digital Signal Processor) is the main data processing and communications unit of the SkyVUE 8. It hosts two separate time keeping circuits that are cross checked. An alarm is triggered if the circuits disagree.

TOP (top of the unit) provides safety shutdown features such as over and under laser output level. It also contains the calibration circuitry and dirty windows system.

PSU (Power Supply Unit) controls the power supply including battery charging and deep discharge protection.

The SkyVUE 8 has a rugged environmental enclosure that protects the instrument from the harshest conditions and will measure the atmosphere with high stability and repeatability.

2.1.1 Cloud height detection

A scatter profile is measured as described in [Measurement of the attenuated backscatter profile](#) (p. 89).

Cloud height detection is carried out as described in [Cloud height calculation](#) (p. 91). Up to four cloud heights can be detected.

If clouds are not detected, the SkyVUE 8 will give one of these reports:

- No significant backscatter.
- Full obscuration determined but no cloud base detected. This is reported if the criteria for detecting cloud base is not met but the integrated scattering coefficient reaches the limit of vertical visibility below a set height limit. The default value is 2000 m (6560 ft) but can be changed by the user. The height at which this occurs is given as vertical visibility.
- Some obscuration detected but determined to be transparent is reported if scattering is detected but no cloud is detected and the calculated vertical visibility exceeds a set height limit.

If no cloud is detected but significant scattering is detected below 50 m (160 ft), then vertical visibility is set to 0.

2.1.2 Sky condition

Sky condition is an assessment of cloud cover measured in units of eighths known as oktas. The number of oktas is the density of cloud in eighths of that layer. The SkyVUE 8 can report up to five layers of cloud when reporting sky condition. The algorithm used in the SkyVUE 8 follows guidance in the *ICAO 9837, Manual on Automatic Meteorological Observing Systems at Aerodromes*.

Sky condition is not an instantaneous measurement. It is based on cloud data for the previous 30 minutes, with cloud detection in the previous 10 minutes given an extra weighting. Therefore, sky condition is not available until sufficient data has been collected. See [Sky condition algorithm description](#) (p. 92) for more detail.

2.1.3 Backscatter profile reporting

Several possible data messages give the two-way attenuated backscatter profile. This consists of 2048 groups of five-character values (10,240 characters in total). Each character is 8 bits long and therefore each 5 figure group is 40 bits. They are given as signed two complement integers and numbers greater than $2^{39}-1$ represent negative integers.

NOTE:

After 1600, the remaining groups are all of 00000.

Therefore, each group actually represents negative, a value between -2^{39} to $+(2^{39}-1)$, rather than 0 to $(2^{40}-1)$, which would be the case for unsigned, positive, 40-bit integers.

Apply the following two-stage process to correct the decimal value:

1. Convert the hexadecimal characters to a decimal number.
2. If the number resulting from this conversion is greater than 1048575, subtract 1,099,511,627,776, which is 2^{40} .

To use this backscatter coefficient in units of $\text{sr}^{-1} \text{m}^{-1}$, the sensor multiplies the calculated decimal number by a factor of 10^{-8} . The values are scaled by the **Attenuated_SCALE** parameter, see [Table 5-1](#) (p. 28).

NOTE:

The profile is not corrected for tilt angle even if cloud heights are corrected.

2.2 Optical measurement

FIGURE 2-1. Principle of operation

2.2.1 Optical arrangement

The SkyVUE 8 uses a single biaxial lens design that increases optical signal-to-noise ratio, while maintaining Class 1M eye safety by integrating larger optics into a compact package (see [FIGURE 2-1](#) (p. 8)). Half of the lens is used by the transmitter, and the other half is used by the receiver. This design provides an alternative to traditional two lens or common-optics designs. The optical isolation of traditional biaxial systems is maintained to increase detector sensitivity, while the low overlap onset height of common-optics systems is incorporated to allow measurements at close ranges.

2.3 Internal monitoring

The SkyVUE 8 monitors window contamination, key voltages and currents, internal temperature and relative humidity, and other parameters relevant to its performance. Data messages (see [Operation](#) (p. 25)) include this information allowing remote diagnosis of the SkyVUE 8 condition. In addition, a special status message can be polled.

2.4 Specifications

2.4.1 Measurement specifications	9
2.4.2 Mechanical specifications	9
2.4.3 Electrical specifications	10
2.4.4 Optical specifications	12
2.4.5 Environmental specifications	12
2.4.6 Communications specifications	12
2.4.7 Compliance and testing	13

2.4.1 Measurement specifications

Maximum reporting range:	8 km (26,250 ft)
Minimum reporting resolution:	5 m (15 ft)
Hard target range accuracy:	$\pm 0.25\% \pm 4.6$ m (15 ft)
Reporting cycle:	2 to 600 s
Cloud layers reported:	Up to four layers reported, instantaneously. Up to five layers reported in Sky Condition.

2.4.2 Mechanical specifications

Height:	737 mm (29 in)
Width:	294 mm (11.6 in)
Depth:	240 mm (9.5 in)
Total weight:	18 kg (40 lb), excluding cables
Shipping weight:	24.6 kg (54 lb)
Base plate:	316 x 316 mm (12.4 in x 12.4 in)

FIGURE 2-2. SkyVUE 8 dimensions

2.4.3 Electrical specifications

Power required:	Nominal 115 VAC (106 to 137 VAC) or nominal 230 VAC (216 to 253 VAC) (automatic selection), 47 to 63 Hz, 380 W total maximum
DSP:	10 to 40 VDC input; 1 A at 12 VDC; 0.5 A at 24 VDC
12V OUT:	12 VDC / 1.7 A for optional or external equipment (if the SkyVUE 8 is using a DC supply, this must be greater than 14 VDC for this to be available.)
Heater:	Input not used with AC heaters.
Hood heater:	220 W, maximum (not available in DC operation)
Internal heater:	110 W, maximum (not available in DC operation)
Fuses:	
DSP fuse:	HBC 5A (T)

PSU fuse: HBC 5A (T)

All fuses are 5 x 20 mm slow blow (T) and are the same for both 115 VAC and 230 VAC.

Battery: Internal 12 V, 7 Ah sealed lead-acid battery. The power supply is equipped with a system to prevent deep discharge of the battery.

The heaters are resistive, which is advantageous when connected to generators or when current consumption is important.

FIGURE 2-3. PSU types

2.4.4 Optical specifications

Pulse duration:	100 ns
Pulse frequency:	10 kHz
Wavelength:	912 ± 5 nm
Half-angle laser divergence:	0.44 mrad
Field of view:	2.0 mrad
Laser lifetime:	10 years typical
Eye safety class:	1M

2.4.5 Environmental specifications

Standard operating temperature range:	−40 to 60 °C (excluding battery)
Battery temperature range:	−20 to 50 °C (alternative battery types available)
Relative humidity range:	0 to 100%
IP rating:	IP 66
Maximum wind speed:	55 m/s

2.4.6 Communications specifications

Supported serial settings:	8 bits, no parity, 1 stop bit (default)	
	7 bits, even parity, 1 stop bit	
	7 bits, odd parity, 1 stop bit	
Supported data rates:	300 baud	19200 baud
	600 baud	38400 baud
	1200 baud	57600 baud
	2400 baud	76800 baud
	4800 baud	115200 baud (default)
	9600 baud	
Supported standards:	RS-232 (default)	
	RS-485 full duplex	
	RS-485 half duplex	

Signal voltage levels:

	Minimum value	Nominal value	Maximum value
RS-232 communications			
RS-232 input threshold low	0.8 V	1.5 V	–
RS-232 input threshold high	–	2.0 V	2.4 V
RS-232 input absolute maximum	–15 V	–	+15 V
RS-232 input resistance	12 K Ω	–	–
RS-232 output voltage low	–	–	0.4 V
RS-232 output voltage high (into 3 K Ω)	4.4 V	–	–
RS-485/422 communications			
RS-485/422 input threshold voltage	–0.2 V	–	+0.2 V
RS-485/422 output (unloaded)	–	–	5V
RS-485/422 output (load 50 Ω)	2 V	–	–
Maximum voltage at any terminal	–7 V	–	+7 V

USB Service Port USB1.1 and 2.0 compatible, fixed 115200 baud.

2.4.7 Compliance and testing

NOTE:

Further details regarding compliance and testing are available upon request.

EMC compliance:	EN 61326-1:2013
Electrical safety compliance:	EN 61010-1:2010
Laser safety compliance:	EN 60825-1:2014
Eye safety standard:	Class 1M
Vibration:	BS EN 60068-2-6:2008 Test Fc: Vibration (Sinusoidal)
Frequency range:	5 to 150 Hz (exceeds Lloyd's Register test levels)

3. Initial preparation and checks

The following steps will provide basic familiarization with the SkyVUE 8 and perform basic functionality checks. To do these, open the door and connect the battery (see [Connecting the back-up battery](#) (p. 22)).

WARNING:

The laser begins operating as soon as the battery is connected. Do not point the laser in any direction where it could be viewed with magnifying optics.

The green LED visible from above should flash once every 10 seconds (see [FIGURE 5-2](#) (p. 61)).

Connect the SkyVUE 8 **USB** port (see [FIGURE 4-5](#) (p. 22)) to a computer and use a terminal emulation program to set to 115200 baud, 8N1 bits/parity settings.

The computer should identify the USB connection and allocate a port number. Enter the port setting in the terminal emulator program. Older computer operating systems may need upgrading or additional software.

The SkyVUE 8 will output message type 004 (default) every 30 seconds (see [CS messages](#) (p. 63)).

Use the **open 0** command to open the terminal mode. You should now see the prompt **CS136>**. Type **Status** to see the sensor status information described in [Status command](#) (p. 46). If using date/time information, checked it since the date/time can drift up to ± 14 seconds per day.

If the unit has been in storage or transit for more than a few months, the clock battery may be discharged. However, it will charge from the back-up battery or mains power.

Use the **Close** command to exit the terminal mode. It will close automatically after 10 minutes of inactivity.

If you are not installing the unit and connecting mains power, you should disconnect the battery to avoid it being discharged.

4. Installation

4.1 Location and orientation	15
4.2 Grounding	15
4.3 Mounting the SkyVUE 8	16
4.4 Tilt angle	17
4.5 Connectors and wiring	18
4.6 Connecting the back-up battery	22
4.7 Bird spike kit	23
4.8 Storage information	24

4.1 Location and orientation

The SkyVUE 8 measures environmental variables and is designed to be located in harsh weather conditions. However, there are a few considerations to take into account if accurate and representative data from a site are to be obtained.

To reduce the service frequency with the unit, place the SkyVUE 8 away from sources of contamination. More regular maintenance will be required when the instrument is placed in areas where contamination is unavoidable or where measurements may be safety related.

Take care that the orientation allows tilting in whatever direction is desired.

WARNING:

If installing at an airport, check and follow local guidance for allowed locations for a non-frangible object 1 m (3.2 ft) tall. Please contact Campbell Scientific if frangible fittings are required.

4.2 Grounding

The SkyVUE 8 must be properly grounded by taking a ground wire with a minimum cross sectional area of 16 mm² (0.62 in) and maximum length of 10 m (32.8 ft) from the brass grounding boss to an adequate grounding point. [FIGURE 2-2](#) (p. 10)) shows the location of the grounding boss.

4.3 Mounting the SkyVUE 8

Mount the SkyVUE 8 by bolting to a firm, level foundation. When bolting down, ensure the SkyVUE 8 can tilt in all desired directions. [FIGURE 4-1](#) (p. 16) shows the mounting footprint. If a suitable surface does not already exist, construct a concrete foundation, at least 600 mm (23.6 in) square and 600 mm (23.6 in) deep, by using the following procedure:

1. Drill four 12 mm (0.47 in) diameter holes using the mount base as a template (see [FIGURE 4-1](#) (p. 16)) to a depth of 77 mm (3.03 in).
2. Clean the holes of all debris.
3. Place washers and nuts on the ends of the wedge anchors supplied (to protect the threads during installation).
4. Hammer the wedge anchors into the holes until the start of the threads are below the surface.
5. Tighten the nuts until about 25 mm (0.98 in) of thread protrudes above the surface.
6. Remove the washers and nuts from the protruding length screw, then lower the SkyVUE 8 into place.
7. Secure the SkyVUE 8 with the washers and nuts.
8. If the surface is not level and flat, add washers under the base on one or more of the foundation screws.

FIGURE 4-1. Mounting base footprint

4.4 Tilt angle

The SkyVUE 8 can be tilted 6°, 12°, 18° or 24° from vertical. In tropical regions, tilting the sensor north in the northern hemisphere and south in the southern hemisphere can prevent the sun from shining directly into the sensor. The tilt angle also can reduce problems caused by direct specular reflections from ice crystals, and prevent rain or snow from falling onto the window. To adjust the tilt angle, remove the bolts shown in [FIGURE 4-2](#) (p. 17), move the SkyVUE 8 to the required tilt angle, and replace the bolts.

The SkyVUE 8 has tilt sensors in both axes to compensate the cloud height when the base is not level. Set or disable cloud height compensation by using the **UNITS** command ([Terminal mode command examples](#) (p. 27)). This feature is useful for mobile or marine applications. Profile data is NOT compensated but tilt angles are included in data messages.

NOTE:

Increasing the tilt angle beyond 24° can cause significant errors in vertical visibility measurements if scatter coefficients vary significantly with height.

FIGURE 4-2. Setting the tilt angle

4.5 Connectors and wiring

- 4.5.1 Base connectors 18
- 4.5.2 Wiring using supplied Campbell Scientific cables 19
- 4.5.3 USB connection 21
- 4.5.4 I/O connection 22

4.5.1 Base connectors

The SkyVUE 8 has two connectors on its base. One connector (6 pins) is for communications; another connector (4 pins) provides power to the unit.

NOTE:

Tilting the unit provides better access to these connectors.

FIGURE 4-3. Connector layout

The function of the connector pins is shown in [Table 4-1](#) (p. 18), [Table 4-2](#) (p. 19), and [Table 4-3](#) (p. 19).

Table 4-1: Function of the connector pins for the mains connector		
Pin	Function	Color of supplied cable cores
1	Live	Brown
2	Not connected	NA
3	Neutral	Blue
4	Earth	Green/yellow

Table 4-2: Function of the connector pins for the blower/heater connector

Pin	Function	Color of supplied cable cores
1	Neutral	Black (1)
2	Fan + 12 VDC	Black (2)
3	Thermistor	Black (3)
4	Thermistor (0 V)	Black (4)
5	Switched 230/115 VAC high voltage heater	Black (5)
6	Switched 230/115 VAC low voltage heater	Black (6)
E	Earth	Green/yellow

Table 4-3: Function of the connector pins for the communications connector

Pin on connector on SkyVUE 8	Color of supplied cable cores	9-pin D connector	RS-232	RS-485 half duplex	RS-485 full duplex/ RS-422
1	Red	8	CTS (DCE) output	B/D+	Y/TXD non-inverting
2	Yellow	7	RTS (DCE) input		B/RXD non-inverting
3	Green	5	Gnd		
4	Black			Gnd	Gnd
5	White	2	RXD (DCE) output	A/D-	Z/TXD inverting
6	Blue	3	TXD (DCE) input		A/RXD inverting
E	Screen				

4.5.2 Wiring using supplied Campbell Scientific cables

Two cables are supplied, each 10 m (32.8 ft) long. One is for the mains power supply and the other is for communications.

WARNING:

Incorrectly wiring the power cable can cause irrevocable damage to the unit and can cause serious injury or death.

WARNING:

The power cable must not be carrying mains voltage when it is being connected or disconnected.

4.5.2.1 Power connections

The following is a guide for wiring and installing a permanent power supply.

As the sensor is used outside, a qualified electrician should install the power cables. Please check local safety regulations.

Ensure that the termination type, cable type, and cable run of the mains power source complies with local regulations and fits the installation requirements.

The power source needs to provide the correct voltage, frequency, and current in excess of the power requirement of the system.

Voltage requirements: 106 to 137 VAC or 216 to 253 VAC (auto select)

Power requirements: 380 W

Input frequency: 47 to 63 Hz

The power source needs fuses with ratings of 5 A or larger and a slow-blow design. Cable extensions or replacement cables should be capable of carrying current in excess of that fuse rating.

Include a two-pole isolator as close to the sensor as is possible.

The power cable needs three conductors (live, neutral, and a protective earth), normally with IEC wiring colors to match those used.

The equipment requires the connection of earth ground using the earth wire of the power connector/cable or via the earth stud on the sensor base. Ensure the earth connection at the power source is suitable for this purpose.

This equipment also requires correct connection of the live and neutral conductors — make sure these are identified and wired correctly at the power source.

Normally, fit the power source with its own or system wide earth leakage breaker (also known as an RCD).

For short term testing of the sensor, fit the power cable with a suitable plug can be fitted to the end of the power cable and the sensor plugged into a standard mains supply capable of

providing 5 A at the rated voltage. If this is done, the earth wire of the sensor must be connected to a suitable protective earth point.

For DC operation, the SkyVUE 8 requires a 10 to 40 VDC supply capable of 1 A at 12 VDC or 0.5 A at 24 VDC.

4.5.2.2 Communications connections

The communications cable terminates at one end with a removable 9-pin, D-connector (DB9). The D-connector connects directly to a computer or data logger such as the Campbell Scientific CR1000X using a suitable interconnecting cable such as the SC110. FIGURE 4-4 (p. 21). The connector can easily be removed for direct connection to screw terminals.

See www.campbellsci.com/downloads/skyvue-example-programs for CRBasic programs that connect the SkyVUE 8 to a Campbell Scientific data logger.

CAUTION:

The supplied cable is not recommended for lengths greater than 10 m (32.8 ft). Longer RS-485 cables should incorporate twisted pairs. Contact Campbell Scientific if needing longer cable lengths.

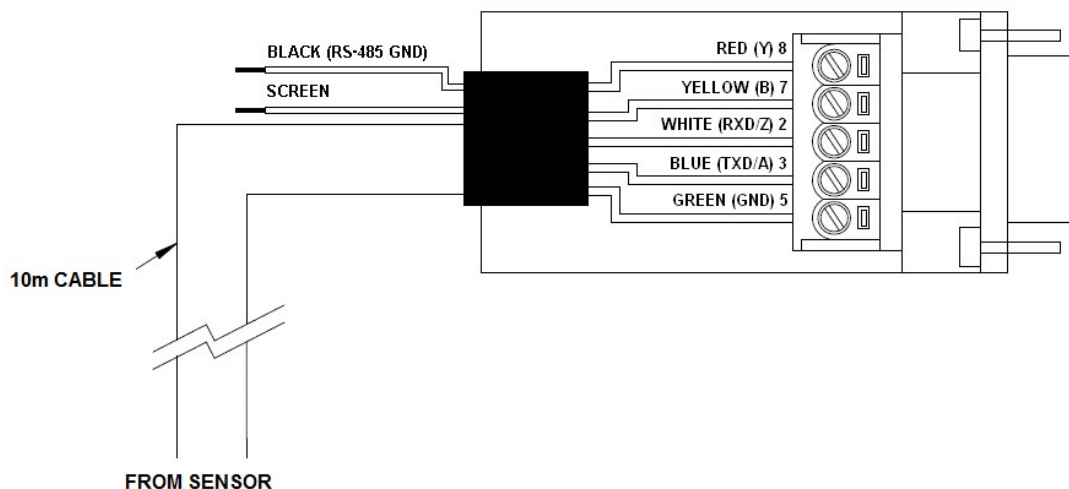

FIGURE 4-4. Cable connections

4.5.3 USB connection

The USB port provided inside the enclosure is for on-site maintenance. It supports communication of commands to the SkyVUE 8 and responses in the same form as the main serial port, except the baud rate is fixed at 115200 (see FIGURE 4-5 (p. 22)).

FIGURE 4-5. USB port

4.5.4 I/O connection

The I/O port is only used for factory setting of the instrument.

4.6 Connecting the back-up battery

The SkyVUE 8 is shipped with the back-up battery disconnected and includes desiccant used for transport. Before using the unit, open the door, connect the internal battery (FIGURE 4-6 (p. 22), remove the desiccant, and close the door.

FIGURE 4-6. Connecting battery

4.7 Bird spike kit

The optional bird spike kit deters birds from sitting on the SkyVUE 8. It includes four stainless-steel spikes with rounded ends and a small reel of stainless-steel wire. The following figure shows installed bird spikes.

FIGURE 4-7. Ceilometer bird spike kit installed

To install the bird spikes, remove the cowl and blanking plugs from the cowl ([FIGURE 4-8](#) (p. 23)). If the SkyVUE 8 is an older unit without pre-existing holes, then drill four holes each 4.5 mm (0.17 in) diameter, evenly spaced around the aperture and 10 mm (0.39 in) in from the edge. For each hole, place a nut and washer then thread the spike into the hole. Tighten the nuts and washers (see [FIGURE 4-9](#) (p. 24)). Replace the cowl on the SkyVUE 8.

FIGURE 4-8. Preparing the SkyVUE 8 for installing the bird spikes

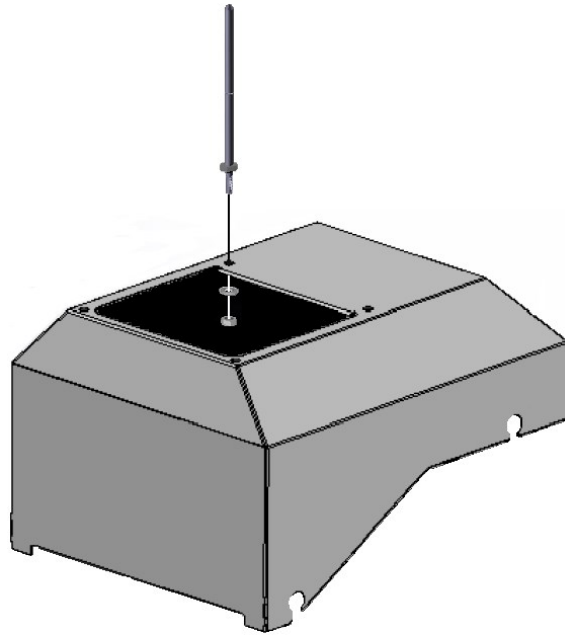

FIGURE 4-9. Attaching bird spikes to the SkyVUE 8 cowl

Wrap the stainless steel wire around each spike using the grooves in the spike then wrap it back on itself.

CAUTION:

Do not tighten the wire too much as it may pull the spikes inwards and obscure the field of view of the SkyVUE 8 optics.

Only use one strand of wire to reduce the possibility of water drops being collected.

Check the wire during maintenance and replace if necessary.

4.8 Storage information

Store the SkyVUE 8 in a dry place at -40 to 70 °C, preferably with the enclosures securely fastened. Protect the optics from possible accidental damage. Disconnect the back-up battery when storing the SkyVUE 8.

NOTE:

If the battery remains connected during storage, the unit will be powered until the battery voltage falls below a shut-down threshold.

NOTE:

Storing the SkyVUE 8 below 0.0 °C will increase the start-up time by up to ten minutes. At –20 °C, the SkyVUE 8 will not achieve full accuracy for an hour.

NOTE:

Remove the battery if the SkyVUE 8 is to be stored outside the –20 to 50 °C temperature range.

5. Operation

5.1 Terminal mode	25
5.2 Restoring factory defaults	60
5.3 LED indicator	61

5.1 Terminal mode

5.1.1 Entering/exiting the SkyVUE 8 terminal mode	26
5.1.2 Terminal mode commands general	26
5.1.3 Terminal mode command examples	27
5.1.4 Application command message types	41
5.1.5 MCFG command message types	43
5.1.6 Measurement and message intervals	44
5.1.7 Status command	46
5.1.8 Message polling	54
5.1.9 Loading a new operating system (OS)	55
5.1.10 Stratocumulus backscatter calibration	56
5.1.11 CRC-16 codes on terminal commands	58
5.1.12 Service command	58
5.1.13 Locked features	60

5.1.1 Entering/exiting the SkyVUE 8 terminal mode

Use the **OPEN Sensor_ID Password** command to enter the menu system. The menu will time out and close automatically if not used for ten minutes.

Sensor_ID is the SkyVUE 8 identification, a single character 0-9, a-f, A-F case sensitive. Default is 0. Enter the password if using one. The following text should be displayed:

```
CS136>. The SkyVUE 8 is now ready for terminal mode commands.
```

The SkyVUE 8 commands are not case sensitive, but the parameters and password are case sensitive.

Example of the open command followed by the **0** parameter:

```
OPEN 0
```

Example of the open command with the password **Secret**:

```
OPEN 0 Secret
```

5.1.2 Terminal mode commands general

[Table 5-1](#) (p. 28) provides a summary of the terminal mode commands.

To send commands that setup and control the SkyVUE 8, use the terminal interface, data logger, or terminal emulators built into many Campbell Scientific software products.

NOTE:

To load an operating system (OS), you need a terminal emulator with XMODEM protocol such as Tera Term.

Use the following settings:

Setting	RS-232/422/485 interface (default)	USB service port
	RS-232	
Baud rate	115200	115200
Data bits	8	8
Parity	none	none
Stop bits	1	1
Flow control	none	none

The baud rate of the SkyVUE 8 must match the port setting baud rate in the terminal emulator. The SkyVUE 8 should now be ready to accept commands.

NOTE:

Commands will always output all parameters on a new line after a CR LF (carriage return and line feed) and then the SkyVUE 8 prompt **CS136>**. If you only want to see parameter values without changing them, then enter the command without parameters. If a particular parameter did not need changing, then the parameter can be replaced with a comma (,). Back space will abort the command.

5.1.3 Terminal mode command examples

How to enter a command

Example 1

The following text shows an example of setting up the SkyVUE 8 serial port. This example sets the serial port to RS-232 hand shaking at 115200 bps, 8 data bits, no parity and if it was in RS-485 mode, then a 100 ms turn around delay.

```
serial 0 10 0 100
```

You could also type the following to obtain the same results as the RS-485 turn around delay is not needed:

```
serial 0 10 0
```

To change only the data baud rate, you can replace mode parameter, with a comma (,) as shown below.

```
serial , 10
```

Alternatively if you just wished to change the parity to 8-bits no parity, then type the following:

```
serial , , 0
```

You do not need to replace the remaining parameters with a comma (,); you only need to replace the ones up to the parameter you wish to edit.

NOTE:

Leave a space character between the command and the parameters as shown in the examples.

Example 2

Entering the **MCFG** command, as shown below, will set the sensor to send messages at 10 second intervals and to send one message only with the message number 112.

```
MCFG 10 112 0 0 0 0 (return)
```

The four zeros indicate that no other message outputs have been set. The **MCFG** command is described in [Table 5-1](#) (p. 28).

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
ALARMS	Angle	Angle is the threshold tilt angle of the sensor beyond which an alarm will be flagged. The settable range is 0 to 90.0 degrees tilt and the default is 45.0 degrees.
APPLICATION	Application_n	<p>Application_n selects pre-configured user settings optimized for a specific application. For the following values of n:</p> <ul style="list-style-type: none"> 0 = Help 10 = Aviation 20 = Research 40 = Meteorology 225 = User defaults <p>The default application for the SkyVUE 8 is 10, Aviation. Settings adjusted by the APPLICATION command include settings in BS, MCFG, and UNITS.</p>
BS (see Measurement and message intervals (p. 44) for more information on compatibility of different parameters)	Attenuated_SCALE, BS_Av_Time, Noise_Gate, Measurement_Period, Rolling_Average, Message_Interval BS_Temporal_Filter_Mode	<p>Rules for BS command are:</p> <p>BS_Av_Time <= Measurement_Period-1s.</p> <p>Message_Interval must be a multiple of Measurement_Period.</p> <p>Attenuated_SCALE is the scalar for the attenuated backscatter percent. 0.001 to 100% (default 100%)</p> <p>BS_Av_Time is the backscatter average time in seconds. 1 to 30 (default 7).</p> <p>Note: Must not be greater than Measurement_Period - 1.0</p> <p>Noise_Gate controls the noise threshold applied to back-scatter.</p> <p>Noise_Gate = -1000, all backscatter range is corrected.</p> <p>Noise_Gate = 0.0 to 1000.0, standard deviation</p>

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		<p>(default 2) for noise threshold. Only backscatter above this is range corrected.</p> <p>Measurement_Period = 0 or 2 to 600 seconds (default 10). If set to 0 and the SkyVUE 8 is polled, it will output the last measurement made. If between 2 and 600 seconds, the SkyVUE 8 continually outputs messages. For sky condition output, Campbell Scientific recommends setting the measurement_Period \leq 30 seconds. If a measurement_Period is greater than 30 seconds, the sky condition algorithm will be less able to resolve coverage for higher layers.</p> <p>Note: Must be a sub multiple of Message_Interval</p> <p>Rolling_Average = 1 to 29 (default 3). This is the number of measurement_periods to use in a rolling average of the backscatter.</p> <p>Message_Interval is the message interval in seconds. Range is 2 to 600 seconds (default 10 s); 0 gives polled messages.</p> <p>Note: Must be a multiple of Measurement_Period</p> <p>BS_Temporal_Filter_Mode allows the selection of backscatter filtering modes.</p> <p>0 = Averaging 1 = Median signal processing</p> <p>Default setting is 1, the median mode for aviation.</p>
CLOSE	No parameters	Closes the terminal interface to allow normal message output and saves new settings to flash non-volatile storage.
CLOUDMODE	CLOUDMODE_A	CLOUDMODE_A turns on a filter that reports the

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		highest cloud during precipitation to avoid precipitation from being reported as low cloud. 0 = Filter Off 1 = Filter On (default). Reports the highest cloud during precipitation
DEFAULTS	No parameters	Loads factory defaults
GETUSER		Reads all user settings as a string of text. Parameters are read in the following order: user = text user volVer = user volume version OS_VER = DSP OS version PsuOsVer = PSU OS version TopOsVer = TOP OS version Id = SkyVUE 8 ID Pw = SkyVUE 8 password terminalCrc = terminal crc mode terminalTimeout = terminal timeout unitsTiltMode = units and tilt mode hoodHBMode = hood heater / fan heater mode hoodHBTestInt = hood heater / blower test interval in hours battBoost_mV = boost voltage used for battery charging mV battCharge_mA = battery charge current mA psuPresent = PSU present switch hoodHBNormSpeed = fan voltage for normal speed mV hoodHBHighSpeed = fan voltage for high speed mV

Heater/Blower test interval</p>
HELP	No parameters	Calls up a list of user commands with brief descriptions
HOFFSET	Height_offset	Height_offset is the offset to be added or subtracted in the range of ±1000 m (±3281 ft). Positive

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		values are added to measured height and negative values are subtracted from measured height. The default is 0.
ID	Sensor_ID	Reads or sets the sensor ID, a single character, 0-9, a - z or A - Z, case sensitive. Default ID = 0. Note: Lower case letters are not allowed if using a CT25K message.
LASER	Laser Laser_Power	Laser = 0, laser off after power up (user must switch laser on) Laser = 1, laser on after power up (default) Laser_Power = 20% to 100%, default 100%
LASEROFF	No parameters	Instructs the SkyVUE 8 to turn the laser off until either a power cycle or the sensor is instructed to turn the laser back on.
LASERON	No parameters	Instructs the SkyVUE 8 to try and turn the laser on
LOADOS	Module	Loads new operating system. This command must be sent using XMODEM protocol. Refer to Loading a new operating system (OS) (p. 55) for more information.
MCFG	Message_Interval Message_ID_A Message_ID_B Message_ID_C Message_ID_D Message_ID_E	Set or read message configuration Message_Interval is the message interval in seconds. Range is 2 to 600 s (default 10); 0 gives polled messages. Note: This command may affect measurement parameters within the BS command. See Measurement and message intervals (p. 44). Message_ID is the message type to output between 0 and 999 (default 001). If Message_ID = 0, no message type is output. Up to five messages can be set (refer to MCFG command message types (p. 43)).

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
OPEN	ID Password	Opens the SkyVUE 8 terminal mode ID = Sensor ID as per the terminal ID command. AnySkyVUE 8 with firmware OS2 or newer will respond to global ID = 99, regardless of its own ID number. Password = The sensors user password as per the terminal PASSWORD command. The default is no password.
PASSWORD	Password	Sets or clears a password from 1 to 10 characters in length. Valid characters, 0-9, a - z or A – Z, and letters are case sensitive. Typing the PASSWORD command without any parameters clears the password. The default is no password.
POLL	Sensor_ID Message_ID	Requests Message_ID from Sensor_ID. Refer to Message polling (p. 54) for more information on this command Note: If Message_ID is omitted, the SkyVUE 8 outputs the message configured by MCFG.
POWEROFF	No parameters	Prepares the PSU to power down the SkyVUE 8 even if the battery is connected. As soon as the mains supply is disconnected, the SkyVUE 8 will power off and NOT run on battery back-up. The SkyVUE 8 can be re-activated with battery back-up enabled by reconnecting the mains supply. You will be asked to confirm.
REBOOT	No parameters	Forces a system reboot. This will restore previously saved user settings. Any unsaved changes will be lost. (Settings are saved in the terminal mode when the CLOSE command is typed, which exits the terminal mode).
SCCAL	No parameters but	Stratocumulus backscatter calibration.

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
	user interaction required	This requires a human observer to confirm a stable Stratocumulus cloud layer between 250 m to 2500 m without holes, precipitation or reduced visibility and has been stable for at least 10 minutes prior to running this command. See Stratocumulus backscatter calibration (p. 56) for more information.
SERIAL	Mode Baud Bits_Parity Delay	Set or read the serial port. Mode = 0, RS-232, full duplex (default) Mode = 1, RS-232, half duplex Mode = 2, RS-485, full duplex Mode = 3, RS-485, half duplex Mode = 4, reserved Mode = 5, RS-422, full duplex Baud = 0, 300 baud Baud = 1, 600 baud Baud = 2, 1200 baud Baud = 3, 2400 baud Baud = 4, 4800 baud Baud = 5, 9600 baud Baud = 6, 19200 baud Baud = 7, 38400 baud Baud = 8, 57600 baud Baud = 9, 76800 baud Baud = 10, 115200 baud (default) Bits_Parity = 0, 8 bits, no parity, 1 stop bit (default) Bits_Parity = 1, 7 bits, even parity, 1 stop bit Bits_Parity = 2, 7 bits, odd parity, 1 stop bit

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		<p>DeLay = delay time, in milliseconds, before transmitting (RS-485 half-duplex mode only). Range: 0 to 100 ms (default 100 ms).</p>
SERVICE	No parameters but user intervention required	Performs a service procedure

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		<p>snrMarginDetector = cloud detection threshold</p> <p>alphaGuessEnd = cloud alpha guess at boundary</p> <p>alphaMin = cloud detection alpha minimum</p> <p>Vc1d_D = cloud detection</p> <p>delta_Vc1d_D = cloud detection</p> <p>vis_Av_T = cloud detection</p> <p>alphaGuess = visibility initial alpha guess</p> <p>ratioLevel = visibility ratio</p> <p>alphaMin = visibility alpha minimum</p> <p>cap = visibility cap in meters</p> <p>tiltLimit = tilt limit in degrees used by alarms</p> <p>noiseGate = attenuated backscatter noise gate mode</p> <p>vvLimit_percent = sky condition report vertical visibility %</p> <p>alphaGuessStart = cloud detection alpha guess at lowest height bin</p> <p>Reserved</p> <p>Reserved</p> <p>Reserved</p> <p>Reserved</p> <p>Reserved</p> <p>Reserved</p> <p>c1oudMode = cloud detector mode parameter (03072019a)</p> <p>CRC = 4-digit character. CRC calculated from the u up to but not including the CRC using the standard CRC-16.</p>

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
		<p>Note: String is added as text and should be cut and pasted from a stored file.</p>
STATUS	No parameters	<p>Outputs SkyVUE 8, serial number, ID, DSP OS version, Time and Date, DSP version, TOP OS version, PSU OS version, watch dog counts, serial parameters, blower heater mode, internal heater mode, message parameters, tilt angle, units, temperature/humidity, temperatures, supply voltages, height offset, visibility cap, laser run days, window parameters, backscatter parameters, features, alarms, warnings, and status.</p> <p>Note: Refer to Status command (p. 46) for more information on this command</p>
TERMINAL	Terminal Timeout	<p>Sets the user terminal time out.</p> <p>Timeout is the delay in minutes from 1 to 15 where the terminal will automatically close if no characters are sent to the SkyVUE 8. The default is 10 minutes.</p>
TIME	Date_Time	<p>Date is in the format yyyy/mm/dd</p> <p>Time is in the format hh:mm:ss</p> <p>yyyy=year, mm=month, dd=day</p> <p>hh=hours, mm=minutes, ss=seconds</p> <p>For example: time 2013/05/25 10:00:00, sets the date and time to May 25, 2013 at 10:00:00)</p> <p>Note: The set time could drift by up to ±14 seconds a day.</p>

Table 5-1: Summary of the terminal mode commands available

Command	Parameter/ parameter block	Description
UNITS	Units	Sets measurement units and tilt correction Units = 0, meters corrected by tilt Units = 1, meters not corrected by tilt Units = 2, feet corrected by tilt (default) Units = 3, feet not corrected by tilt
VIS	Cap	Cap is the vertical visibility maximum range 100 to 10000 in meters or 328 to 32808 in feet (default 2000 m or 6561 ft).

NOTE:

If AUTO is set, then the heater / blower will heat to 80 °C if (sky condition > 1 okta coverage) or (cloud height < 3 km (9842 ft) AND sky condition > 1 okta coverage) OR window Tx < 80% OR precipitation detected. When the event has passed, the blower/heater will remain active at 80 °C for a further 15 minutes before going into a fan-off state and the heater temperature drops to an average of approximately 40 °C, ready to be activated again.

5.1.4 Application command message types

The **Application_n** parameter for the APPLICATION command defines settings to optimize the ceilometer for a range of applications, Aviation, Research and Meteorology. The default application setting for the SkyVUE 8 is Aviation, but this can be changed, or returned to, using the **Application_n** command.

Users can adjust any element of these settings once an application has been applied through the following individual commands: **ALARMS**, **BS**, **CLOUDMODE**, **MCFG** and **UNITS**.

Table 5-2: Summary of applications and applied settings for SkyVUE 8

Settings	Application modes for SkyVUE 8 using OS2 and newer			Defaults using OS1
	Aviation (default)	Research	Meteorology	General application
ALARMS (tilt degs)	30	45	45	45
APPLICATION: Application n (sets user application settings)	Application 10	Application 20	Application 40	N/A
BS: Attenuated scale (%)	100	100	100	100
BS: Backscatter averaging time (s)	2	7	7	7
BS: Noise Gate	2 (ON)	-1000 (OFF)	-1000 (OFF)	-1000 (OFF)
BS: Measurement Period (s)	10	10	10	10
BS: Rolling Averages (sets the number of readings for averaging. Alternative description: Backscatter temporal filter rolling samples)	3	6	3	3
BS: Message Interval (s)	30	30	30	30
BS: BS_Temporal_Filter_Mode (Sets Averaging or Median Mode.)	1 (Median)	0 (Average)	0 (Average)	N/A (Average)
CLOUDMODE: CloudMode_A (Reports highest cloud only during precipitation)	ON	OFF	ON	N/A
MCFG: Message ID	4 (CB,SC,BS)	6 (CB,SC,MLH,BS)	4 (CB,SC,BS)	4 (CB,SC,BS)
UNITS	2 (Feet, tilt corrected)	0 (Meters, tilt corrected)	0 (Meters, tilt corrected)	0 (Meters, tilt corrected)

5.1.5 MCFG command message types

The **Message_ID_x** parameter for the **MCFG** commands defines the output types. Refer to [Messages](#) (p. 62) for further information on message output types.

Message_ID_x type	Description
000	No message
001	Campbell Scientific Message 1, no sky condition, no profile data
002	Campbell Scientific Message 2, no sky condition, profile data, 1600 range bins, 5 m resolution. 2048 bins in total are output. However, after bin 1600, the bins only contain zeros.
003	Campbell Scientific Message 3, sky condition, no profile data
004 (default)	Campbell Scientific Message 4, sky condition and profile data, 1600 range bins, 5 m resolution. 2048 bins in total are output. However, after bin 1600, the bins only contain zeros.
101	CL31 Message 1, 770 range bins, 10 m resolution
102	CL31 Message 1, 385 range bins, 20 m resolution
103	CL31 Message 1, 1500 range bins, 5 m resolution
104	CL31 Message 1, 770 range bins, 5 m resolution
105	CL31 Message 1, No profile data
106	CL31 Message 1, Full SkyVUE 8 output, 1600 range bins, 5 m resolution. 2048 bins in total are output. However, after bin 1600, the bins only contain zeros.
107	CL31 Message 2, 770 range bins, 10 m resolution
108	CL31 Message 2, 385 range bins, 20 m resolution
109	CL31 Message 2, 1500 range bins, 5 m resolution
110	CL31 Message 2, 770 range bins, 5 m resolution
111	CL31 Message 2, No profile data
112	CL31 Message 2, Full SkyVUE 8 output, 1600 range bins, 5 m resolution. 2048 bins in total are output. However, after bin 1600, the bins only contain zeros.
113	CT25K Message 1
114	CT25K Message 6

5.1.6 Measurement and message intervals

The message interval is the time, in seconds, between the automatic message transmissions. It can be set between 2 to 600 s (0 gives polled messages). The default is 10, meaning a message will be sent automatically every 10 seconds. The message interval must be a multiple of the measurement period.

The backscatter average time, **BS_Av_Time**, is the period over which the laser is firing and taking measurements.

The measurement period is the time interval between the start of backscatter average time (**BS_Av_Time**), during which the laser fires, and the start of the next measurement period. The measurement period must be long enough to include the backscatter average time and some processing time. The minimum measurement period is 2 seconds, which assumes the backscatter average time is 1 second. The measurement period can be set between 2 to 600 s (default is 10 s). If it is set to 0, then measurements must be polled.

The rolling average (1 to 29, default 3) is the number of periods used to calculate each scatter value that is either used in a profile message or in a calculation of cloud height.

The message interval chosen may affect measurement parameters allowed within the **BS** command, which can be used to set non-standard measurement parameters) as follows:

If message interval = measurement period = 2 (the lowest values allowed), then the backscatter average time (**BS_Av_Time**) must equal 1 and the rolling average must equal 1.

If the message interval is between 3 and 9 s, then the measurement period must be the same as the message interval.

In the following examples, yellow means laser firing.

To comply with the requirements for Sky Condition the total measurement period for rolling averages should not exceed 30 seconds.

In this case, the SkyVUE 8 sends a message every 2 seconds based on one measurement averaged over 1 second. Therefore, each message is based on a single 1 second period of backscatter average data.

Laser firing (yellow)																		
(BS_AV_Time) = 1 s	1 s																	
Measurement Period = 2 s	2 s																	
Message Interval = 2 s	2 s																	

In this case, with the rolling average set to 1, the SkyVUE 8 sends a message every 30 seconds. It takes three, 2 second, measurements at 10 second intervals. Only the last measurement is used in

the output message but all three are used for calculating sky condition. Therefore, each message is based on a single 2 second period of backscatter average data.

Laser firing (yellow)										
(BS_AV_Time) = 2 s	2 s									
Measurement Period = 10 s	10 s		10 s		10 s					
Message Interval = 30 s	30 s									

In this case, with the rolling average set to 3 (default), the SkyVUE 8 sends a message every 30 seconds that contains the average of the latest three measurements. Therefore, each message is based on three, 10 second measurement periods, with each containing 2 seconds of backscatter average data.

Laser firing (yellow)										
(BS_AV_Time) = 2 s	2 s									
Measurement Period = 10 s	10 s		10 s		10 s					
Message Interval = 30 s	30 s									

In this case, with the rolling average set to 3 (default), the SkyVUE 8 sends a message every 10 seconds that contains the average of the latest three measurements. Therefore, each message is based on three, 10 second measurement periods, with each containing 2 seconds of backscatter average data.

Laser firing (yellow)										
(BS_AV_Time) = 2 s	2 s									
Measurement Period = 10 s	10 s		10 s		10 s					
Message Interval = 10 s	10 s		10 s		10 s					

In this case, the SkyVUE 8 sends a message every 14 seconds based on one measurement taking 4 seconds over a 14 second interval. Therefore, each message is based on a single 4 second period of average data.

Laser firing (yellow)								
(BS_AV_Time) = 4 s								
Measurement Period = 14 s	14 s		14 s		14 s		14 s	
Message Interval = 14 s	14 s		14 s		14 s		14 s	

This message cannot be set up using the **MCFG** command alone.

The **BS** command has to be used as follows:

BS_Av_Time (averaging period) has to be set to 4, not the default value.

5.1.7 Status command

The **STATUS** command returns the following information:

Line	Example line output
1	Identification CS136 SN1000 ID 0
Description of the line sections	
Section	Description
CS136	Product name
SN1000	Sensor serial number
ID 0	Sensor identification number

Line	Example line output
2	Date Time 2012/01/10 11:39:46
Description of the line sections

22	Flags 0000 0000 0000
Description of the most significant alarm word (left side, bits going left to right). Each alarm word is a hexadecimal sum of all the error bits.	
Bit	Description
8000 XXXX XXXX	Units. feet = 0, meters = 8
4000 XXXX XXXX	Reserved for future use
2000 XXXX XXXX	Reserved for future use
1000 XXXX XXXX	Reserved for future use
0800 XXXX XXXX	DSP clock out of specification
0400 XXXX XXXX	Laser shut down due to operating temperature out of range
0200 XXXX XXXX	The lead acid battery voltage is reading low
0100 XXXX XXXX	Mains supply has failed (requires a PSU to be present)
0080 XXXX XXXX	The external heater blower assembly temperature is out of bounds
0040 XXXX XXXX	External heater blower failure
0020 XXXX XXXX	The PSUs internal temperature is high
0010 XXXX XXXX	PSU OS has failed its signature check
0008 XXXX XXXX	No communications between DSP and PSU
0004 XXXX XXXX	Photo diode and Laser windows are dirty. This can only be set if the laser is on
0002 XXXX XXXX	Tilt beyond limit set by user, default 45 degrees
0001 XXXX XXXX	No communications between DSP and inclinometer board

Description of the middle alarm word (middle word, bits going left to right)	
Bit	Description
XXXX 8000 XXXX	The sensors internal humidity is high
XXXX 4000 XXXX	Communications to the DSP boards temperature and humidity chip have failed
XXXX 2000 XXXX	DSP input supply voltage is low
XXXX 1000 XXXX	Self-test active
XXXX 0800 XXXX	Watch dog counter updated
XXXX 0400 XXXX	User setting stored in flash failed their signature checks
XXXX 0200 XXXX	DSP factory calibration stored in flash has failed its signature check
XXXX 0100 XXXX	DSP board OS signature test failed
XXXX 0080 XXXX	DSP board RAM test failed
XXXX 0040 XXXX	DSP boards on board PSUs are out of bounds
XXXX 0020 XXXX	TOP board non-volatile storage is corrupt
XXXX 0010 XXXX	TOP board OS signature test has failed
XXXX 0008 XXXX	TOP boards ADC and DAC are not within specifications
XXXX 0004 XXXX	TOP boards on board PSUs are out of bounds
XXXX 0002 XXXX	Communications have failed between TOP board and the DSP
XXXX 0001 XXXX	Photo diode background radiance is out of range

Description of the least significant alarm word (right side, bits going left to right)	
Bit	Description
XXXX XXXX 8000	Photo diode temperature is out of range
XXXX XXXX 4000	Photo diode is saturated
XXXX XXXX 2000	Photo diode calibrator temperature is out of range
XXXX XXXX 1000	Photo diode calibrator has failed
XXXX XXXX 0800	The sensor could not reach the desired gain levels
XXXX XXXX 0400	Laser run time has been exceeded
XXXX XXXX 0200	Laser temperature out of range
XXXX XXXX 0100	Laser thermistor failure
XXXX XXXX 0080	Laser is obscured. This can only be set if the laser is on
XXXX XXXX 0040	Laser did not achieve significant output power
XXXX XXXX 0020	Laser max power exceeded
XXXX XXXX 0010	Laser max drive current exceeded
XXXX XXXX 0008	Laser power monitor temperature out of range
XXXX XXXX 0004	Laser power monitor test fail
XXXX XXXX 0002	Laser shutdown by top board
XXXX XXXX 0001	Laser is off

5.1.8 Message polling

The `POLL Sensor_ID Message_ID` command requests the `Message_ID` from the `Sensor_ID`. Where `Message_ID` is a SkyVUE 8 message type as defined in [MCFG command message types](#) (p. 43).

The following example uses the SkyVUE 8 `POLL` command to request preconfigured message outputs.

First configure the SkyVUE 8 to use polling mode from the terminal interface via the `MCFG` command as follows:

```
CS136> MCFG 0
010000
```

This configures the SkyVUE 8 into polling mode leaving your message output configurations unchanged. Exit the terminal by typing the **CLOSE** command. This will save the changes you just made.

```
CS136> CLOSE
```

```
COMMAND CLOSED
```

Automatic message outputs should continue. Type the **POLL** command as shown below to verify that the system is working as expected.

NOTE:

Once exited, the terminal characters will not be automatically echoed back to you.

```
POLL 0
```

This should return all messages you have set via the **MCFG** command. In this example, only default message output was set. Therefore, the **POLL** command returns text similar to the following.

NOTE:

If you have no message configured, the **MCFG** command returns **0 0 0 0 0**, then nothing will be returned from the command you just typed.

```
CS0100001
```

```
10 100 12345 ///// ///// ///// 000000000000
```

```
abcd
```

The following example shows how to use the **POLL** command to request a specific message output type.

To poll the SkyVUE 8 for a particular message type, enter the following.

```
POLL 0 113
```

This command requests CT25K Message 1 and should look similar to the following.

```
CT00010
```

```
10 12345 ///// ///// 00000f80
```

5.1.9 Loading a new operating system (OS)

A new OS can be entered with the **LOADOS** command.

NOTE:

The new OS must be sent using xmodem protocol using Tera Term. See [Terminal mode commands general](#) (p. 26).

To load a new operating system:

Enter terminal mode by typing **Open 0** (for a sensor with the default ID 0)

This will return the prompt: **CS136>**

Type the command: **LOADOS**

The SkyVUE 8 will respond:

Load OS into DSP

DO NOT REMOVE POWER DURING OS UPDATE!!!

Waiting for xmodem

At this point, use your terminal emulator to send the appropriate file. Loading the OS could take a few minutes.

When the process is complete the SkyVUE 8 will return the message:

Updating DSP OS, please wait....PASS

Updating TOP OS, please wait....PASS

Updating PSU OS, please wait....PASS

Wait 40 sec for OS to restart

Afterwards, the SkyVUE 8 will resume operation according to the previously set operating parameters. It will no longer be in terminal mode.

5.1.10 Stratocumulus backscatter calibration

The **SCCAL** command allows a simple stratocumulus backscatter calibration of the scatter coefficient measurements. This requires a human observer to confirm a stable Stratocumulus cloud layer between 250 m (820 ft) to 2500 m (8202 ft) without holes, precipitation or reduced visibility, and has been stable for at least 10 minutes prior to running this command.

Set the **Measurement_Period** to 10 (see [Table 5-1](#) (p. 28)).

A detailed description of this technique is given in: Ewan J. O'Connor, Anthony J. Illingworth, and Robin J. Hogan, 2004: A Technique for Autocalibration of Cloud Lidar. *Journal of Atmospheric and Ocean Technology*, **21**, pp 777 – 786.

Enter terminal mode by typing **Open 0** (for a sensor with an ID of 0)

This will return the prompt: **CS136>**

Type `SCCAL`

The SkyVUE 8 will respond:

Stratocumulus calibration.

Enter height above sea level (m)? Press enter to continue:

Enter the sensor height above sea level, for example 70 m then type return.

The SkyVUE 8 will respond: **70 m entered, is this correct? "Y", "N" or "Q"**

Type **Y** to confirm. If you have entered an incorrect number, type **N** and you will be able to replace it. Type **Q** to quit the calibration and return to the terminal command prompt.

The SkyVUE 8 will respond:

For correct calibration a trained human observer must confirm that the layer is between 250 m (820 ft) to 2500 m (8200 ft) and has been stable for at least 10 minutes without drizzle. Has the Stratocumulus been stable for at least 10 minutes? "Y" or "N"

To confirm, type **Y** and the SkyVUE 8 will respond:

Old Stratocumulus calibration = 0.0282

New Stratocumulus calibration parameters = 0.0258 70 1328

Do you want to apply this calibration? "Y" or "N"

In this example, 70 is the height of the sensor above sea level previously entered and 1210 is the cloud base in meters above the sensor.

As a rough guide, if the calibration factor has changed by less than 20%, there is no need to change. If it has changed by a factor of 2, it is wise to run the service routine on the sensor (see [Service command](#) (p. 58)).

Type **Y** to confirm and the SkyVUE 8 will respond:

Calibration saved.

The following error messages may appear during the process.

- **Error ... Time out**
- **Error ... Cloud not detected or height not within limits (250 m to 2500 m / 820 ft to 8200 ft)**
- **Try again when layer is stable**
- **Error ... Not enough data available try again in 10 minutes.**

5.1.11 CRC-16 codes on terminal commands

If CRC-16 on mode is set using the **Terminal** command, all terminal commands need a CRC-16. A semi-colon is used to indicate start of the CRC-16 in 4-byte character, for example **open 0;233A**. The CRC-16 is calculated either from the start of a new line or after a [STX] up to but not including the semi-colon. ETX can follow the CRC-16 if required.

To find the valid CRC-16 for a command, type the command and then type: ;?????. For example, typing **open 0;????** gives the response [CRLF]CRC>233A<CRC[CRLF] so **233A** is the CRC-16.

The CRC-16 is not case sensitive.

NOTE:

Make sure the terminal software sends [CR] and not [CRLF] for the command-line termination.

The table below gives some commonly used CRC-16 codes.

Terminal command	CRC-16
open 0	233A
close	D94E
status	7CE5
password	EB85
terminal 0 (this command will remove CRC-16 checking)	B576
defaults	7D8E
serial	7FCE

5.1.12 Service command

The service command triggers the SkyVUE 8 to go through a series of tests including tests that require the white test surface (ceilometer calibration plate supplied) to be placed on the SkyVUE 8 windows.

The service command results in the following procedures:

- System noise level including noise spike test
- Detector maximum gain test
- Simulates a clear night sky for calibration offset
- Window contamination functionality test
- Laser function and monitoring alarm check

- Thermistor fault alarm check
- Calibrator LED alarm check
- PSU supply alarm check
- Temperature RH% sensor alarm check
- Inclinator alarm check
- Heater/blower alarm check
- Internal clocks alarm check
- Top board and PSU communications alarm check.

If any test or check has failed, then full instrument status and debug information is output with a fault summary at the end.

The response is similar to the following:

Initially the SkyVUE 8 outputs a STATUS message, then goes through various self-test routines before requesting a white test surface to be placed over each of the windows in turn. This process is as follows:

self test, please wait

wait for new measurement.....

Place white test surface onto detector window (left side fan at the top)

Press Enter to continue

Cover the detector window and press **Enter** . The computer will respond:

wait for new measurement.....

Place white test surface onto laser window (right side fan at the top)

Press Enter to continue

Cover the laser window and press **Enter** . The computer will respond:

wait for new measurement.....

Remove white test surface from laser window. Press Enter to continue.

When this is complete, the SkyVUE 8 will output a string of diagnostic data similar. This is useful for a Campbell Scientific engineer investigating problems with the SkyVUE 8.

Finally, the SkyVUE 8 will list any faults found as shown below:

******* CS136 FAULT list *******

FAULT - external heater/blower thermistor

FAULT - detector dirty windows with white test surface

FAULT - max APD gain not achieved

Otherwise it will report the following message:

```
***** CS136 has PASSED all tests *****
```

5.1.13 Locked features

Optional features are protected by a key. They are enabled by typing UNLOCK followed by entering the key. This is specific to the individual SkyVUE 8 and only has to be entered once.

5.2 Restoring factory defaults

Restore factory defaults by using the DEFAULTS command in the terminal mode.

Hard Reset

Alternatively, use the RESET push switch on the DSP to restore factory defaults ([FIGURE 5-1](#) (p. 61)).

First open the access door.

WARNING:

Opening the access door **MUST** be carried out by a competent person, who has sufficient training, experience and knowledge both in electrical safety and the detail and operation of the sensor.

WARNING:

Opening the access door may expose hot surfaces.

Use a narrow tool such as a screw driver to reach the reset switch.

If the reset switch is pushed for four seconds, the SkyVUE 8 will reboot in exactly the same way as the REBOOT terminal command. If it is held closed while the SkyVUE 8 is powered off and on again, it will return to factory defaults. To power cycle the SkyVUE 8, disconnect the battery and switch the main power off and on.

FIGURE 5-1. Restoring factory defaults

5.3 LED indicator

FIGURE 5-2. LED indicator

A green LED is visible through the window, see [FIGURE 5-2](#) (p. 61). It will give 0.5 second flashes as follows:

Permanently on = top board firmware fault

1 flash every 10 seconds = OK, no fault

2 flashes every 10 seconds = warning (possible degraded performance)

3 flashes every 10 seconds = alarm (measurements not possible)

6. Messages

6.1 Data messages general	62
6.2 Checksums used in SkyVUE 8 messages	62
6.3 CS messages	63
6.4 CL31 messages	76
6.5 CT25K messages	81

6.1 Data messages general

The SkyVUE 8 can provide a variety of data message types to allow efficient output of data. Not all messages provide the full information available, but these messages may be more efficient in terms of data storage and transmission.

CL31 and CT25K messages follow formats used by common existing CL31 and CT25K sensors allowing easier replacement or network expansion.

6.2 Checksums used in SkyVUE 8 messages

This is based on the CRC-16 with the output XOR'd with Hex 0xFFFF and outputs a two-byte CRC-16 character. The CRC-16 is calculated on all characters after the SOH character up to and including the ETX character.

The following example uses the C code to calculate the SkyVUE 8 checksum.

NOTE:

Shorts are 16 bits long and ints are 32 bits long.

```

// -----
// Calculate CRC-16
// buf is a pointer to the input string
// len is the length of the input string
// -----
unsigned short crc16(char *buffer, int length)
{
    unsigned short crc;
    unsigned short m;
    int i, j;

    crc = 0xFFFF;
    for (i=0; i < length; ++i)
    {
        crc ^= buffer[i] << 8;

        for (j=0; j<8; ++j){
            m = (crc & 0x8000) ? 0x1021 : 0;
            crc <<= 1;
            crc ^= m;
        }
    }
    crc ^= 0xFFFF;
    return crc;
}

```

6.3 CS messages

6.3.1 MESSAGE 001 (no profile, no sky condition)

Example message line outputs

```

flags (12 characters in 3 groups of 4) = Alarm or warning information

Table 6-1: Most significant alarm word for CS messages	
Bit¹	Description
8000 XXXX XXXX	Units. Feet = 0, meter = 1.
4000 XXXX XXXX	Reserved for future use
2000 XXXX XXXX	Reserved for future use
1000 XXXX XXXX	Reserved for future use
0800 XXXX XXXX	DSP clock out of specification
0400 XXXX XXXX	Laser shut down due to operating temperature out of range
0200 XXXX XXXX	The lead acid battery voltage is reading low
0100 XXXX XXXX	Mains supply has failed (requires a PSU to be present)
0080 XXXX XXXX	The external heater blower assembly temperature is out of bounds
0040 XXXX XXXX	External heater blower failure
0020 XXXX XXXX	The PSUs internal temperature is high
0010 XXXX XXXX	PSU OS has failed its signature check
0008 XXXX XXXX	No communications between DSP and PSU
0004 XXXX XXXX	Photo diode and Laser windows are dirty. This can only be set if the laser is on
0002 XXXX XXXX	Tilt beyond limit set by user, default 45 degrees
0001 XXXX XXXX	No communications between DSP and inclinometer board
¹ Alarm words are sum of error bits.	

Table 6-2: Middle alarm word for CS messages	
Bit¹	Description
XXXX 8000 XXXX	The sensors internal humidity is high
XXXX 4000 XXXX	Communications to the DSP board temperature and humidity chip have failed
XXXX 2000 XXXX	DSP input supply voltage is low

Table 6-2: Middle alarm word for CS messages

Bit ¹	Description
XXXX 1000 XXXX	Self-test active
XXXX 0800 XXXX	Watch dog counter updated
XXXX 0400 XXXX	User setting stored in flash failed their signature checks
XXXX 0200 XXXX	DSP factory calibration stored in flash has failed its signature check
XXXX 0100 XXXX	DSP board OS signature test failed
XXXX 0080 XXXX	DSP board RAM test failed
XXXX 0040 XXXX	DSP boards on board PSUs are out of bounds
XXXX 0020 XXXX	TOP board non-volatile storage is corrupt
XXXX 0010 XXXX	TOP board OS signature test has failed
XXXX 0008 XXXX	TOP boards ADC and DAC are not within specifications
XXXX 0004 XXXX	TOP boards on board PSUs are out of bounds
XXXX 0002 XXXX	Communications have failed between TOP board and the DSP
XXXX 0001 XXXX	Photo diode background radiance is out of range
¹ Alarm words are sum of error bits.	

Table 6-3: Least significant alarm word for CS messages

Bit ¹	Description
XXXX XXXX 8000	Photo diode temperature is out of range
XXXX XXXX 4000	Photo diode is saturated
XXXX XXXX 2000	Photo diode calibrator temperature is out of range
XXXX XXXX 1000	Photo diode calibrator has failed
XXXX XXXX 0800	The sensor could not reach the desired gain levels
XXXX XXXX 0400	Laser run time or maximum laser drive current has been exceeded
XXXX XXXX 0200	Laser temperature out of range
XXXX XXXX 0100	Laser thermistor failure
XXXX XXXX 0080	Laser is obscured. This can only be set if the laser is on

Table 6-3: Least significant alarm word for CS messages

Bit ¹	Description
XXXX XXXX 0040	Laser did not achieve significant output power
XXXX XXXX 0020	Laser max power exceeded
XXXX XXXX 0010	Laser max drive current exceeded
XXXX XXXX 0008	Laser power monitor temperature out of range
XXXX XXXX 0004	Laser power monitor test fail
XXXX XXXX 0002	Laser shutdown by top board
XXXX XXXX 0001	Laser is off

¹ Alarm words are sum of error bits.

7. Maintenance

7.1 General	86
7.2 Cleaning	86
7.3 Diagnostic LED indicators within the enclosure	87
7.4 Electrical safety testing	88

7.1 General

The SkyVUE 8 is a robust weather resistant instrument and there is no need for routine maintenance other than cleaning. The instrument performance is monitored, and any potential problems are indicated by error messages.

7.2 Cleaning

The SkyVUE 8 window will require cleaning from time to time. The frequency of required cleaning depends on the exposure of the instrument to contaminants such as salt and dust. This will vary depending on the site location. The SkyVUE 8 is capable of self diagnosing dirty lenses and will indicate in its output when the lenses are contaminated.

In any case, we suggest six monthly intervals for locations not prone to contaminants and monthly intervals for those prone to contamination (coastal, roadside or airport use). In some

cases, more frequent cleaning may be required where there are high levels of contaminants and high dependency on the instrument output.

CAUTION:

If the window requires cleaning, it is very important that only a proper lens cloth or lens tissue is used. The use of inappropriate materials to clean the windows can permanently damage or reduce their effectiveness leading to reduced performance.

When the top cover is removed, avoid spraying the fan assembly with liquids. Use damp lens wipes or a clean soft cloth to clean the windows.

Use an air duster to blow any loose dust and dirt from the window as a first step. Use a lint free lens cloth or lens tissue impregnated with a non-aggressive standard window cleaner. Clean the surface by dragging the cloth across it being careful not to apply excessive pressure.

Excessive pressure may lead to some types of contaminants scratching the window surface. Over time such scratches can lead to reduced sensitivity.

7.3 Diagnostic LED indicators within the enclosure

The **LASER ON** and **STATUS** green LEDs are visible on the DSP (see [FIGURE 7-1](#) (p. 88)). Their function is as follows:

LASER ON LED:

- Off = laser off
- Flashing = laser fault
- On = laser on

STATUS LED:

- 1 flash every 10 seconds = OK
- 2 flashes every 10 seconds = warning (possible degraded performance)
- 3 flashes every 10 seconds = alarm (measurements not possible)

The DSP **STATUS** LED provides the same function as the LED visible through the top window.

The red LED on the PSU flashes for 0.5 seconds:

- Permanently on = PSU firmware fault
- 1 flash every 10 seconds = PSU OK
- 2 flashes every 10 seconds = running in battery mode
- 3 flashes every 10 seconds = no communications to the DSP. This takes 60 seconds to start after a communications failure.

FIGURE 7-1. Diagnostic LED indicators

The red LED on the laser module indicates:

- Off = Laser off
- On = Laser on

7.4 Electrical safety testing

NOTE:

If carrying out insulation tests, do not use test voltages above 300 V RMS because the sensor is designed to clamp any mains input voltages above this level. Voltage clamping can result in a false failure being detected.

Appendix A. Measurement of the attenuated backscatter profile

A.1 Initial measurement	89
A.2 Backscatter onset height detection	89
A.3 Produce attenuated backscatter output message	90

A.1 Initial measurement

- Pulse the laser and measure the backscatter at optimal gains.
- Derive the impulse response and impulse correct the backscatter signal using the inverse filter derived.
- Remove the residual offset and slope from the impulse corrected backscatter.
- Apply an overlap correction based on the known generic overlap function of the SkyVUE 8.
- Apply the backscatter calibration constants.
- Remove the laser and electronic artefact signature. This is specific to the individual SkyVUE 8 and determined during calibration.

A.2 Backscatter onset height detection

- Filter the backscatter with 20 m (65.6 ft) and 300 m (984 ft) width filters.
- Look for a 1500 m (4921 ft) block width where the standard deviation is at a minimum for both the 20 m (65.6 ft) and 300 m (984 ft) width filtered backscatters.
- Create a detection threshold by multiplying the 20 m (65.6 ft) and 300 m (984 ft) standard deviations by a constant.
- Find the onset of backscatter height by working from the highest height bin downwards until the backscatter is above one or both of the two detection thresholds.

A.3 Produce attenuated backscatter output message

- Range correct the backscatter to produce the attenuated backscatter.
- Attenuated backscatter (output), calibrated, range corrected but not tilt corrected.
- Smooth with a 20 m (65.6 ft) width running average.
- A noise gate can be applied based on a multiple of the 20 m (65.6 ft) detection threshold — this is customer configurable.
- The lower height range bins do not gate noise until the backscatter reaches zero.

Appendix B. Cloud height calculation

The scatter profile is inverted (using the Klett inversion technique) and an extinction profile is calculated.

Cloud base heights are identified using two criteria as follows (cloud is detected if either of them is met).

Criterion 1: likely cloud bases are estimated based on increasing slope of the extinction profile of at least 7 m (22.9 ft) per bin (bin width is 5 m (16.4 ft) and an extinction threshold. This threshold is based on an extinction coefficient (EXCO) of 3, equivalent to a horizontal visibility (MOR) of 1000 m (3280 ft). This results in a number of possible cloud bases at different heights.

Criterion 2: horizontal visibility falls below an average of 4800 m (15,748 ft) over 300 m (984 ft) starting at an altitude of 1000 m (3280 ft).

To report a cloud layer above a lower one the scatter coefficient first has to fall below the extinction threshold used for cloud definitions (less a small hysteresis offset). The scatter profile must then again meet the criteria above.

If rain is detected, the sensitivity of detection is increased by a factor of 3.

To avoid many very narrow close layers being reported when they have little significance a minimum separation based on WMO reporting intervals is applied. The separation is ± 30 m (98 ft) below 1500 m (4921 ft) and 300 m (984 ft) above 1500 m (4921 ft). The lowest cloud height is used. If a thin cloud identified by Criterion 2 above is within ± 150 m (492 ft) of a cloud identified by criterion 1, then the thin cloud is ignored.

Appendix C. Sky condition algorithm description

The SkyVUE 8 sky condition algorithm follows guidance from ICAO and WMO documents¹ and is based on 30 minutes of data. For this reason, sky condition is not available for 30 minutes after power cycling the sensor, a reboot, or changing measurement parameters. The sky condition algorithm is as follows:

Each measured hit comprising the lowest cloud height, (vertical visibility + onset of backscatter) / 2 and a weighting of 1 or 2 is stored in a running half hour buffer.

The weighting is 2 for hits in the last 10 minutes and 1 for hits in the previous 20 minutes.

If >50% of the hits in the latest 10 minutes are vertical visibility, then the vertical visibility averaged over the last 10 minutes is reported. Only hits below the vertical visibility height limit set are used.

The buffer is sorted in height order and hits combined into bins with the following widths:

Height	Bin width
0 – 5000 ft (0 – 1524 m)	100 ft (30.5 m)
5000 – 15,000 ft (1524 – 4572 m)	200 ft (61 m)
15,000 – 26,250 ft (4572 – 8000 m)	500 ft (152 m)

For each bin a mean height is calculated by the following:

$$H_i = \sum(h_i w_i) / \sum(w_i)$$

Where w_i is the weight (1 or 2) of the hit with height h_i

Bins are then reduced. A distance (D) between adjacent bins is calculated by the following equation:

$$D = N_i N_j (H_i - H_j)^2 / (N_i + N_j)$$

¹ICAO 9837 Manual on Automatic Meteorological Observing Systems at Aerodromes.
WMO – No. 306 Manual on Codes

Where N_i and N_j are the sum of hits of each bin and H_i and H_j the respective heights.

Find the pair with the minimum distance D and combine into one bin with the height of the lowest and number of hits of the combined total.

This process is repeated until 5 or less bins remain. These are now taken as cloud layers.

Finally, if cloud layers are closer than the distances below, then they are merged with the height of the lowest and combined total number of hits.

Height range	Distance (D)
Height \leq 300 m (1000 ft)	\leq 90 m (300 ft)
300 m $<$ Height \leq 900 m (1000 ft $<$ Height \leq 3000 ft)	\leq 120 m (400 ft)
900 m $<$ Height \leq 1500 m (3000 ft $<$ Height \leq 5000 ft)	\leq 180 m (600 ft)
1500 m $<$ Height \leq 2400 m (5000 ft $<$ Height \leq 8000 ft)	\leq 300 m (1000 ft)
Height $>$ 2400 m (8000 ft)	\leq 480 m (1600 ft)

Weights per layer are used to calculate number of oktas per layer.

If the total possible is W_{max} , then the cover is $(W_i/W_{max}) \times 8$.

Cloud amounts are rounded up to the next highest whole oktas.

For layers above the lowest this is based on the maximum possible weights. If the lower layers have W_1 hits and the next layer has W_2 hits, then the cover of the higher layer is given by:

$$(W_2/(W_{max}-W_1)) \times 8$$

For example, taking weighting into account, if lower layers of cloud only allow 4/8 of clear sky above and the cover is 2/8 out of those 4/8, then the layer above is taken as 4/8.

Finally, only layers meeting the following criteria are reported:

Layer 1 \geq 1/33 oktas

Layer 2 \geq 3 oktas

Layer 3 \geq 5 oktas

Layer 4 \geq 7 oktas

Layer 5 \geq 7 oktas

Any layer $>$ $(8 - 1/33)$ oktas is reported as 8 oktas

Appendix D. Replacing the SkyVUE 8 PSU

The Power Supply Unit (PSU) can be replaced in the SkyVUE 8 as follows:

1. Disconnect the power to the SkyVUE 8 and open the housing.
2. Disconnect all the plugs from the PSU including the battery.
3. Use a 3 mm ball-end hexagonal-key to remove the two M4 x 12 socket head screws on the chassis plate that are on the bent-up tabs on the left and right hand sides.
4. Pull the PSU forward removing the PSU and battery carrier.
5. Loosen the four screws holding the PSU in place and slide off the PSU.
6. Re-insert the new PSU and push back into position.
7. Replace the two screws on the chassis plate.
8. Re-attach the cable plugs into the correct sockets on the new PSU ensuring that each is connected properly.
9. Ensure that the battery (if used) is reconnected to the PSU.

Chassis plate M4 x 12
socket head screw
(one of two shown)

PSU retaining screws.
Two further screws are located at
the rear of the PSU.

Battery carrier

Appendix E. SkyVUE 8

Laser/APD module replacement

Basic procedure:

1. Isolate the SkyVUE 8 from AC mainspower.
2. Remove the access door using the supplied key.
3. Disconnect the cables from the Power Supply Unit (PSU) including the battery.

NOTE:

It is very important to disconnect the battery from the SkyVUE 8 to ensure that the laser is not powered.

4. Unscrew the two securing screws from the PSU chassis plate so it can be pulled out to gain better access to the Laser and APD module.
5. Now the Laser module and avalanche photo diode (APD) module will be visible.

6. Disconnect the ribbon cable and SMB connector from the module that is being replaced. To avoid damage only pull the gold metal part of the SMB connector.
7. As seen in step 5, the laser module and APD module each have one M5 x 35 mm long socket captive screw with a plain and spring washer securing them. Use a 4 mm ball-end hexagon-key to remove the screws on the module being replaced.

WARNING:

Do not loosen any other screws.

WARNING:

Do not replace screws with different length screws.

8. Remove any protective film from the filters of the new APD and laser modules before mounting them.
9. Once the screws have been removed pull the module off the locating pins. Fit the new module by pushing it onto the locating pins and then re-assembling, in reverse order, using the original screws, spring washers and plain washers.
10. Reconnect the ribbon cable and SMB connector to the module before closing and securing the access door.

NOTE:

Make sure the module sits flat against the plate before tightening the four screws.

Limited warranty

Products manufactured by Campbell Scientific are warranted by Campbell Scientific to be free from defects in materials and workmanship under normal use and service for two years from the date of shipment unless otherwise specified on the corresponding product webpage. See Product Details on the Ordering Information pages at www.campbellsci.com. Other manufacturer's products, that are resold by Campbell Scientific, are warranted only to the limits extended by the original manufacturer.

Refer to www.campbellsci.com/terms#warranty for more information.

CAMPBELL SCIENTIFIC EXPRESSLY DISCLAIMS AND EXCLUDES ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Campbell Scientific hereby disclaims, to the fullest extent allowed by applicable law, any and all warranties and conditions with respect to the Products, whether express, implied or statutory, other than those expressly provided herein.

Assistance

Products may not be returned without prior authorization.

Products shipped to Campbell Scientific require a Returned Materials Authorization (RMA) or Repair Reference number and must be clean and uncontaminated by harmful substances, such as hazardous materials, chemicals, insects, and pests. Please complete the required forms prior to shipping equipment.

Campbell Scientific regional offices handle repairs for customers within their territories. Please see the back page for the Global Sales and Support Network or visit www.campbellsci.com/contact  to determine which Campbell Scientific office serves your country.

To obtain a Returned Materials Authorization or Repair Reference number, contact your CAMPBELL SCIENTIFIC regional office. Please write the issued number clearly on the outside of the shipping container and ship as directed.

For all returns, the customer must provide a "Statement of Product Cleanliness and Decontamination" or "Declaration of Hazardous Material and Decontamination" form and comply with the requirements specified in it. The form is available from your CAMPBELL SCIENTIFIC regional office. Campbell Scientific is unable to process any returns until we receive this statement. If the statement is not received within three days of product receipt or is incomplete, the product will be returned to the customer at the customer's expense. Campbell Scientific reserves the right to refuse service on products that were exposed to contaminants that may cause health or safety concerns for our employees.

Safety

DANGER — MANY HAZARDS ARE ASSOCIATED WITH INSTALLING, USING, MAINTAINING, AND WORKING ON OR AROUND TRIPODS, TOWERS, AND ANY ATTACHMENTS TO TRIPODS AND tripodS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC. FAILURE TO PROPERLY AND COMPLETELY ASSEMBLE, INSTALL, OPERATE, USE, AND MAINTAIN TRIPODS, tripodS, AND ATTACHMENTS, AND FAILURE TO HEED WARNINGS, INCREASES THE RISK OF DEATH, ACCIDENT, SERIOUS INJURY, PROPERTY DAMAGE, AND PRODUCT FAILURE. TAKE ALL REASONABLE PRECAUTIONS TO AVOID THESE HAZARDS. CHECK WITH YOUR ORGANIZATION'S SAFETY COORDINATOR (OR POLICY) FOR PROCEDURES AND REQUIRED PROTECTIVE EQUIPMENT PRIOR TO PERFORMING ANY WORK.

Use tripods, tripods, and attachments to tripods and tripods only for purposes for which they are designed. Do not exceed design limits. Be familiar and comply with all instructions provided in product manuals. Manuals are available at www.campbellsci.com. You are responsible for conformance with governing codes and regulations, including safety regulations, and the integrity and location of structures or land to which tripods, tripods, and any attachments are attached. Installation sites should be evaluated and approved by a qualified engineer. If questions or concerns arise regarding installation, use, or maintenance of tripods, tripods, attachments, or electrical connections, consult with a licensed and qualified engineer or electrician.

General

- Protect from over-voltage.
- Protect electrical equipment from water.
- Protect from electrostatic discharge (ESD).
- Protect from lightning.
- Prior to performing site or installation work, obtain required approvals and permits. Comply with all governing structure-height regulations.
- Use only qualified personnel for installation, use, and maintenance of tripods and tripods, and any attachments to tripods and tripods. The use of licensed and qualified contractors is highly recommended.
- Read all applicable instructions carefully and understand procedures thoroughly before beginning work.
- Wear a **hardhat** and **eye protection**, and take **other appropriate safety precautions** while working on or around tripods and tripods.
- **Do not climb** tripods or tripods at any time, and prohibit climbing by other persons. Take reasonable precautions to secure tripod and tripod sites from trespassers.
- Use only manufacturer recommended parts, materials, and tools.

Utility and Electrical

- **You can be killed** or sustain serious bodily injury if the tripod, tripod, or attachments you are installing, constructing, using, or maintaining, or a tool, stake, or anchor, come in **contact with overhead or underground utility lines**.
- Maintain a distance of at least one-and-one-half times structure height, 6 meters (20 feet), or the distance required by applicable law, **whichever is greater**, between overhead utility lines and the structure (tripod, tripod, attachments, or tools).
- Prior to performing site or installation work, inform all utility companies and have all underground utilities marked.
- Comply with all electrical codes. Electrical equipment and related grounding devices should be installed by a licensed and qualified electrician.
- Only use power sources approved for use in the country of installation to power Campbell Scientific devices.

Elevated Work and Weather

- Exercise extreme caution when performing elevated work.
- Use appropriate equipment and safety practices.
- During installation and maintenance, keep tripod and tripod sites clear of un-trained or non-essential personnel. Take precautions to prevent elevated tools and objects from dropping.
- Do not perform any work in inclement weather, including wind, rain, snow, lightning, etc.

Maintenance

- Periodically (at least yearly) check for wear and damage, including corrosion, stress cracks, frayed cables, loose cable clamps, cable tightness, etc. and take necessary corrective actions.
- Periodically (at least yearly) check electrical ground connections.

Internal Battery

- Be aware of fire, explosion, and severe-burn hazards.
- Misuse or improper installation of the internal lithium battery can cause severe injury.
- Do not recharge, disassemble, heat above 100 °C (212 °F), solder directly to the cell, incinerate, or expose contents to water. Dispose of spent batteries properly.

WHILE EVERY ATTEMPT IS MADE TO EMBODY THE HIGHEST DEGREE OF SAFETY IN ALL CAMPBELL SCIENTIFIC PRODUCTS, THE CUSTOMER ASSUMES ALL RISK FROM ANY INJURY RESULTING FROM IMPROPER INSTALLATION, USE, OR MAINTENANCE OF TRIPODS, tripodS, OR ATTACHMENTS TO TRIPODS AND tripodS SUCH AS SENSORS, CROSSARMS, ENCLOSURES, ANTENNAS, ETC.
